SUMMARY

Software Engineer with 5+ years of experience building automation platforms, infrastructure tooling, platform engineering systems, and backend services across Linux and Windows environments. Experienced in infrastructure as code, CI/CD systems, cloud infrastructure, and scalable backend development using Go, Python, and Ruby. Proven track record improving engineering workflows through automation, internal tooling, and AI-augmented specification-driven development. Passionate about developer productivity, reliable systems, and modern software engineering practices.

EDUCATION

Portland State University

B.S. Computer Science GPA: 3.95

Portland, OR

Sep 2017 - Jun 2021

EXPERIENCE

Puppet By Perforce

Software Engineer II

Remote - Portland, OR

2024 - Present

- Engineered automation solutions for security compliance across Linux and Windows platforms, achieving 95%+ compliance with CIS and OpenSCAP standards.
- Developed and maintained Puppet modules in Ruby to automate infrastructure configuration and compliance enforcement across enterprise systems.
- Collaborated with Product to lead technical discussions, roadmap planning, and feature execution initiatives.
- Engaged in frontier exploration of integrating generative AI into the development process of CloudOps and compliance modules through specification-driven development.
- Established agentic AI skills and agents for internal development.
- Optimized GraphQL queries with caching for CloudOps microservices.
- Maintained and improved CI/CD pipelines supporting automated testing, release workflows, and safer delivery of infrastructure automation tooling.
- Partnered with enterprise customers to troubleshoot and improve automation tooling reliability.

Software Engineer I

Remote - Portland, OR

2021 - 2023

- Developed core architectural features for Puppet compliance modules.
- Contributed to architecture and feature design for enterprise compliance automation modules.
- Improved reliability, maintainability, and performance of enterprise compliance automation modules through targeted bug fixes, refactoring, and production support.

SKILLS

Programming Languages: Golang, Ruby, Python, C, YAML, Puppet DSL

Infrastructure & Cloud: Terraform, GCP, Linux, Infrastructure as Code, Redis, GitHub Actions, Docker

AI-Assisted Development: Specification-driven development and rapid prototyping with Claude Code/Codex

PROJECTS

Local Chatbot Server

https://www.github.com/Tu2607/local_chatbot

Built a Go-based backend service that provides a unified API for local and remote LLM providers. Implemented Redis-backed conversation storage, session caching, and Docker deployment, with ongoing work integrating retrieval-augmented generation (RAG) using ChromaDB.

Find-Ten Game

<https://github.com/Tu2607/Find-Ten>

Developed a puzzle game backend in Go featuring event-driven architecture, concurrent processing, and deterministic state management. Designed a goroutine and channel-based game loop to coordinate timer events, player actions, and game state transitions while avoiding race conditions. Implemented board generation, move validation, scoring, and game-completion detection systems with extensible support for future multiplayer functionality. Applied performance optimization techniques including cached move discovery and efficient board analysis to improve gameplay responsiveness.
